AfiSort

An Extra Hand on the Dairy Farm

Medium and large size dairy farmers treat a significant number of cows on any given day. Breeding, pregnancy, post calving checks, and veterinary treatment for sick cows is just a short-list of checks and examinations that farmers have to perform regularly.

Tracking, selecting and monitoring is an important and demanding task for the herdsman. It is time consuming, requiring data analysis, and can often result in animals being left unattended.

On a farm, tracing the targeted cows among an anonymous mass is as time consuming as finding a needle in a haystack. This task requires extra hands on the dairy farm.

The **AfiSort** Automated Cow traffic control system is the most efficient solution for treating cows in a dairy farm.

AfiSort is a computerized gate control system specially designed to direct cow traffic. Using the comprehensive AfiFarm database, an accurate and consistent method of selecting and sorting cows is achieved automatically.

AfiSort unique design of walk through station minimize interference to cow traffic thus causing no delays in milking.

Afisort is used for separating cows for breeding and other fertility treatments into treatment yards or chutes. This eliminates the need for headlocks in the pens.

AfiSort is an essential tool in modern dairy farming. It is a labor saving system that ensures that no cow is left unattended.

Features

Automated Cow Selection

AfiSort automatically traces the cows that need your attention every day. All you need to do is define the criteria for cows requiring attention and AfiSort does the rest. AfiSort controls the sort gates and separates the cows into their respective treatment areas according to your pre-defined instructions.

Computerized Herd-Control

Leaving the milking parlor, selected groups of cows can be diverted back to their pens. This capability is also used to automatically move cows between pens.

Targeting Cows for Breeding

AfiSort is used for efficiently isolating cows for breeding. This enables quick insemination of cows and avoids the need to stroll over large areas seeking out the cows for insemination.
