Integrates with AfiWeigh
for optional weight
monitoring

Flexible
Integration

Leverage with cow
monitoring, parlor
automation or both

Sorting cows for treatment can be stressful for animals and time intensive for staff. With AfiSort, cows are automatically identified and routed without disrupting cow flow.

AfiSort in Action

AfiSort is available in saloon, free flow and spoon separator configurations, and can be engineered to fit any size farm with multiple sort options, including two-way, three-way, single or multiple sort gate layouts.

NOW I KNOW

“ Sort gates take the
place of an employee.

A BETTER WAY TO MANAGE COW MOVEMENT

AfiSort was designed to let cows be cows while helping employees make the most of every action. Automated sorting streamlines cow flow for seamless health treatments, pregnancy checks, insemination or other management activities.

Save Time

- > Significantly reduce the number of people and the time it takes to locate and treat animals.

Maintain Cow Comfort

- > Calmly sort and treat cows to quickly return them to the barn – without headlocks.

Monitor Weight

- > Add AfiWeigh scales to monitor for weight fluctuations, which could indicate health issues, and support feeding and breeding program adjustments.

Affordable, Streamlined Cow Flow

- > With a free flow configuration, only flagged cows get sorted. All others walk through freely which means decreased cow backup, easier training, and less gate maintenance – plus a highly accurate ID rate (96-99%). Its smaller, 11-ft footprint requires less equipment and material, which lowers cost.

I've always said sort gates are worth \$40,000 a year. It saves general labor to go and help and catch that cow.
